ABSTRACT:
This paper presents the most important ABAP Dictionary repository objects through an example application made in Web Dynpro ABAP. Web Dynpro ABAP applications are built using Model View Controller design pattern where the User Interface can be defined without the need of HTML or JavaScript.

KEYWORDS:
ABAP Dictionary, Web Dynpro ABAP, framework, ABAP programming

1. INTRODUCTION
The ABAP Dictionary manages and describes the data definitions used in the system and this paper presents the most important ABAP Dictionary repository objects, from database tables, data elements, structure, domain, F1 Help until search-help. For a better understanding this repository object are used to build a product presentation page developed in Web Dynpro ABAP to a SAP NetWeaver platform release 7.0 level 15.

Web Dynpro ABAP is the SAP technology to develop business applications where the model, the view together with the controller are the three fundamental building blocks from which an application can be constructed. The Web Dynpro main concept is to reduce development time and to maximize reusability, all the Web Dynpro application use Model View Controller design pattern.

2. WEB DYNPRO ABAP

The Model View Controller pattern is probably the most famous of all patterns, used extensively for both serious and fun purposes [1].

The architecture of Typical MVC implementation is present in fig.1 [2]

![Fig. 1 The architecture of Typical MVC implementation](image-url)
The Web Dynpro Model View Controller have some modification from the typical architecture. We mention: Web Dynpro Framework that it is responsible with the execution of our application, make the communication between the client and the server and communicate with our application through the Hook Methods.

Our Web Dynpro application have 4 sections: Home, Body Care, Nutrition and Skin Care. The home section presented general infos und make external links to the web site from other countries, the Body Care section together with Nutrition and Skin Care present the adequately products. We have build this application to illustrate the use of ABAP Dictionary repository Objects and we make that in fallow sections.

3. ABAP Dictionary repository objects use in our application

For presentation of the most use repository objects that we can create in ABAP Dictionary we have develop a example Web Dynpro application for Unicity product presentation. The images and the product information use to build this application are take from Reference [3].

We have to mention that ABAP Dictionary is completely integrated in the ABAP Workbench - transaction SE11.

3.1. Database Table

The most important ABAP Dictionary repository objects and concomitantly the most commun data storage for a Web Dynpro application are Tables. A table definition in the ABAP Dictionary contains the following components [4]: table fields, foreign keys, technical settings and indexes.

In fig. 1 we present the part from application that present the nutritional products.
The Table `ytab_nutrition` was used to store nutrition products and have the structure present in fig. 3.

![Fig. 3 Structure of ytab_nutrition table](image)

The first field is a SAP specific field (client field) need to entry a three character client ID that represent the client that we use to login into system - Client: `MANDT`.

Data element `MANDT` it is predefined of type `CLNT`, length 3 und short description Client.

The other fields define the columns of our `ytab_nutrition` table: code - unique key, name, image1 and description.

### 3.2. Data elements

For the fields of the tables present in fig. 2 we have use types specific our application, repository objects that we have create in ABAP Dictionary with transaction SE11. We present in fig. 4 the structure of the Data Element `YCODE_N`.

![Fig. 4. The structure of the Data Element YCODE_N](image)

Using Predefined Type we may set properties such as data type - `NUMC` and Length - 7 and using the Field Label tab we may set the label that it is automatically show in the Label or Caption of the Web Dynpro application.

After activation the data element it is release for use.
3.3. Domain with fixed values

A domain defines a value range - fig. 5a and to may use it in the Web Dynpro ABAP, in a DropDownByKey UI Element, we have to assigned to a data element - fig.5b.

We use the data element YDOMAIN_COUNTRY_DATA_TYPE in the HOME section of our Web Dynpro application fig. 6. We create a attribut of this type and we make a data binding to the propertie SelectedKey of the DropDownByKey UI Element. When the user select a country from the list we open the proper external window.

3.4. F1 Help

F1 Help it is use for show a help text for the user. We can store this help text in the ABAP Dictionary for each element. With the F1 key the user can show this text in a new window. The data element YDOMAIN_COUNTRY_DATA_TYPE have the documentation show in fig. 7.
When the user press F1 for the DropDownByKey UI Element a window with the proper documentation it is open, fig. 8.

Fig. 8  Show documentation for DropDownByKey

3.5 Search Help

Search help or F4 help it is a function of R/3 System. We can have elementary search help and collective search help. In fig. 9 we present a elementary search help use for the table YTAB_BODYCARE.

We have use the code field for a search in Web Dynpro application. When we select a name and a description from the selection list, the associated product code from the table will be placed into the input field, fig. 10.

Fig. 9 Search Help for the table YTAB_BODYCARE

Fig. 10 Search Help in Web Dynpro ABAP
A collective Search Help is a grouping of searches but each of individual search help must have at least one parameter in common.

### 3.6. Structure

Structures are composed of any combination of other data types of ABAP Dictionary: data elements, views, table types, others structures, etc. In fig. 11 we present a structure with the same components as the table YTAB_BODYCARE.

![Structure Components](image)

This structure was used for the BAPI, that was imported as model in Web Dynpro application.

### 4. CONCLUSIONS

ABAP Dictionary have an important role because manages and describe the data definitions used in the system. With the help of Web Dynpro ABAP we have show the way we can build and use the most important ABAP Dictionary repository objects.
